BIOPSY MEDIUM - 1

SPECIMEN: Excised specimen of right breast. (474 A - M/23)

CLINICAL DIAGNOSIS: ? Carcinoma breast, right.

GROSS: Received a mastectomy specimen with attached skin, nipple, and areola measuring 18.0 x 15.0 x 5.0 cm. The skin ellipse measures 12.0 x 5.0 cm and appears normal. The cut section shows an irregular, greyish-white mass measuring 2.0 x 1.8 x 1.5 cm, which is 0.1 cm away from the base, 3.0 cm from the nipple and areola, and 3.0, 3.5, 5.0, and 6.0 cm from the other surgical margins. Another mass present in the outer upper quadrant measures 3.0 x 2.5 x 1.5 cm and is 1.0 cm away from the base. No lymph node structure has been identified.

Sections taken: Growth (1st): 3 sections (474 A – C)
Growth (2nd): 3 sections (474 J – L)
Base: 2 sections (474 D, M)
Nipple & areola: 1 section (474 E)
Margins: 4 sections (474 F - I)
(13 sections; GS)

MICROSCOPIC FINDINGS:

Microsections from both masses (right breast) show similar histomorphology and show features of:

- Mass: Invasive ductal carcinoma of breast – no special type; BR Grade –II.
 - Tubule formation – 3
 - Nuclear pleomorphism - 2
 - Mitotic score – 1
 - Total score – 6
- Nipple areola: free from carcinomatous infiltration.
- Surgical margin towards the pectoralis muscle (base): free from carcinomatous infiltration.
- All other surgical cut margins are free from carcinomatous infiltration.
- Lymphovascular invasion: Present.
- Perineural invasion: Not identified.

IMPRESSION: Invasive ductal carcinoma of the breast (right)—no special type; BR Grade II.

Investigation reports only help in arriving diagnosis in combination with clinical presentation. All test have their limitations which are imposed by the limits of specificity and sensitivity of individual assay procedures as well as the specimen received by the laboratory.
